

# Prosody reveals syntactic structure: secondary predication in metrical finite corpus data

Anabelle Caso

Harvard University

47th Penn Linguistics Conference

March 18, 2023

# Table of Contents

- 1 Introduction
- 2 Secondary predication
  - Overview
  - Syntax & semantics
  - Prosody
- 3 Prosody and syntax at work
  - Secondary predicates in finite metrical corpora
  - Vedic & Homeric data
- 4 Conclusion

# Introduction

- ★ Preferentially, morphosyntactic words ( $X^0$ ) map to prosodic words ( $\omega$ ), syntactic phrases (XP) map to prosodic phrases ( $\phi$ ), and clauses (CP) map to intonation phrases ( $\iota$ ) (Selkirk 2009, 2011; Elfner 2012)
- ★ The default relationship between syntactic and prosodic structures = **identity**
- ★ Mismatches arise as a result of the interaction of violable OT constraints (Selkirk 1996, 2011)

# Introduction

- ★ Secondary predicates are distinct **prosodically** and **syntactically** from attributive adjectival/prepositional phrases (Kayne 1985; Ramchand 2008; Irimia 2012)
- ★ Metrical corpora encode prosodically and syntactically marked structures systematically (Hale and Kissock 2021)
  - ★ Assumption: verse  $\neq$  artificial; *a good poet makes use of a poetic formula in linguistically real ways*
- ★ Vedic (Indo-Aryan) & Homeric (Greek) offer richly attested ancient corpora with well understood prosody, but poorly understood syntax

# Introduction

## Goals of study:

- Enrich understanding of Vedic & Homeric syntax via prosody
- Hopefully (but not necessarily): enrich understanding of syntax and prosody of secondary predicates cross-linguistically

# Overview

- Secondary predicates = nonverbal expressions which share an argument with the finite matrix verb in a clause, but which are their own distinct predicates
- ★ Secondary predicates express a **STAGE-LEVEL** (temporary) property as opposed to an **INDIVIDUAL-LEVEL** (permanent) property (Carlson 1977; Kratzer et al. 1995; Casaretto 2020)
- ★ The syntactic categories available for these constructions (AP/PP/PtcpP/ConvP etc.) vary cross-linguistically (Snyder 2001; Irimia 2012; Milway 2019)

# Overview

→ Resultatives express an eventuality which is obtained *as a result of* the action of the primary predicate (Kratzer 2005; Irimia 2012; Milway 2019)

(1) John-ga teeburu-o kiree-ni hui-ta  
 John.NOM table.ACC clean wipe.PST  
 “John wiped the table clean” (Japanese)

(2) die teekane leer trinken  
 the teapot empty drink  
 “to drink the teapot empty” (German)

↪ No overlap between secondary predicate and primary predicate (Irimia 2012)

# Overview

→ Depictives describe the state of their subject *at the time when* the action of the primary predicate occurs (Bruening 2018; Milway 2019)

(3) Ana leyó el libro enferma  
 Ana read.PST the book.M ill  
 “Ana read the book ill” (Spanish)

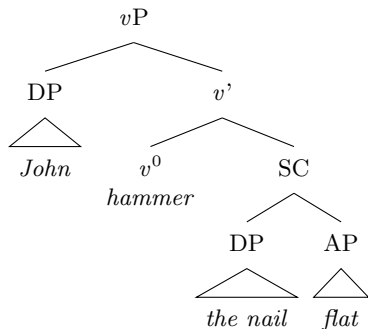

(4) Miyukham fa-nfri-më-an-m  
 fruit eat-raw-REM.PST-1SG-3PL  
 “I ate the fruit raw” (Alamblak)

↪ Overlap between secondary predicate and primary predicate (Irimia 2012)

# Syntax & semantics

- A significant portion of the work on resultatives analyzes them as containing **small clauses** (Kayne 1985; Kratzer 2005; Harley 2007)

- ★ Two events: causation (lexical verb) + result (small clause)
- ★ Object DP = participant in final state

# Syntax & semantics

- Depictive secondary predicates have also be analyzed as small clauses (cf. Pylkkänen 2008), though these analyses are controversial (Bruening 2018)
  - ★ Object DP  $\neq$  part of a separate nonconcurrent event
- “Hybrid” analyses of secondary predicates with small clauses have the object DP moving out of the small clause and becoming an argument of the verbal event (Ramchand 2008; Milway 2019)

# Syntax & semantics

- ★ Approaches to resultatives which include small clauses often see that SC contained within a *resP* projection that includes an operator (Kratzer 2005; Ramchand 2008; Milway 2019)
  - ★ This operator explains away the **observed tendency** of secondary predicates to be **STAGE-LEVEL**
- ★ Maintaining a “hybrid” approach for depictives, a *depP* projection contains an operator and a SC out of which the relevant DP moves

# Syntax & semantics

e.g. Kratzer (2005):

- 1  $[[SC]] \rightsquigarrow \lambda s[\text{STATE}(s) \wedge \text{RESULT}(\text{RESULTEE})(s)]$
- 2  $[[res]] \rightsquigarrow \lambda P.\lambda e.\exists s[\text{EVENT}(e) \wedge \text{STATE}(s) \wedge P(s) \wedge \text{CAUSE}(s)(e)]$
- 3  $[[V^0]] \rightsquigarrow \lambda e[\text{EVENT}(e) \wedge \text{VERB}(e)]$
- 4  $[[VP]] \rightsquigarrow \lambda e[\text{VERB}(e) \wedge \exists s[\text{CAUSE}(s)(e) \wedge \text{RESULT}(\text{RESULTEE})(s)]]$

# Syntax & semantics

- ↪ Kratzer (2005)'s account ensures that the event expressed by the verb is **identical** to the event of causing the result **state**
- ↪ In an analogous depictive structure, the event expressed by the verb and the **state** of the depictive DP at the time of the event are **identical** (Milway 2019)

# Prosody

- ★ Cross-linguistically, secondary predicates tend to be marked by special prosody (Irimia 2012; Milway 2019)
  - ↪ Depictives are thought of as being more prosodically independent than resultatives (Schultze-Berndt and Himmelmann 2004: 66; Irimia 2012: 208)
- ★ Secondary predicates = **prosodically distinct units**
  - ★ Prosodic independence ↔ **clause-like structure**

# Prosody

## Prosody reveals syntactic structure

The distinct prosody observed of secondary predicates = **sensitivity to an  $\iota$  boundary** which maps to the clause-like structure in the syntax

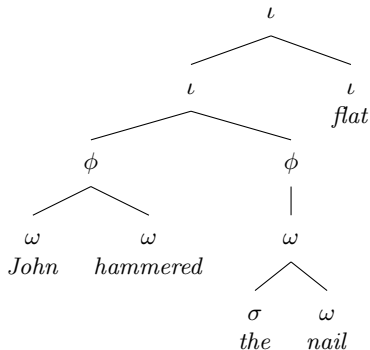

- ★ Open question(s):
  - ★ What consequences are predicted from proposing that secondary predicates constitute an intonational ( $\iota$ ) phrase?
  - ★ LAYEREDNESS  $\gg$  NONRECURSIVITY

# Prosody

- ★ The difference between an attributive structure (i.e. [DP [AP] [NP]]) and one of secondary predication (i.e. [*res*P [SC [DP] [AP]]) can therefore be captured as follows:

TREE 1: attributive adjective

TREE 2: secondary predicate

# Prosody

- ★ In the Homeric poems and the ṚgVeda, elements with marked prosody are subject to strategies of isolation within and across lines (Hale and Kissonock 2021)
- ★ These isolation strategies include:
  - (i) adjacency to a caesura
  - (ii) or sentence final/post-verbal position
  - (iii) the process of *enjambment* whereby syntactic units are broken across multiple prosodic domains (→ metrical lines) at the expense of Selkirk (2011)'s MATCH constraints
  - (iv) a combination of (i)-(iii)

## Secondary predicates in finite metrical corpora

- ↪ Secondary predicates are complex, containing a clause-like boundary and a state-yielding operator
- ↪ Secondary predicates, projecting to a phrase high in the prosodic hierarchy(?), are prosodically marked
- ↪ Metrical corpora encode prosodically marked forms by means of isolation strategies
- ↪ The Homeric poems and the ṚgVeda are metrical corpora
- ∴ Secondary predicates in the Homeric poems and the ṚgVeda, which are prosodically marked, will be prosodically isolated

# Methodology

- ★ RV and Homeric poem search in Mark Hale's corpus for:
  - 1 Cross-linguistically common secondary predicate forms (e.g. naked, raw, sick/ill) → approx. 20
  - 2 Manual collection of secondary predicates via independent translation work (e.g. thick/crowded) → approx. 50
  - 3 Participial constructions (e.g. being) → approx. 30
    - ★ DB Monro (1891)'s *Homeric Grammar*: certain participial constructions “often [have] the character of a distinct Clause, coming at the end of a sentence, and after a metrical pause” (§243.3-a)
- ★ Immediate goal: a tendency in 1-3 to be (a) prosodically isolated and (b) within STAGE-LEVEL predicates
- ★ Long term goal: minimal pairs of attributive and secondary predicate forms that differ in terms of prosodic isolation

# Vedic Sanskrit meter

→ 7 major varieties of ṚV meter attested:

Meter	Syllable structure	Verses
Gāyātrī	8-8-8	2447
Uṣṇih	8-8-12	341
Anuṣṭubh	8-8-8-8	855
Bṛhatī	8-8-12-8	181
Pankti	8-8-8-8+8	312
Triṣṭubh	11-11-11-11	4253
Jagatī	12-12-12-12	1318

- ★ In triṣṭubh (11 syllable) & jagatī (12 syllable) verses:
  - ★ Caesura after syllable 4/5
  - ★ Pause after line break
- ★ Verses with 8 syllables contain a very small number of words per line ∴ distributional tendencies may be arbitrary
  - ignored for purposes of this study

# Homeric Greek meter

→ Dactylic hexameter = “meter of epic”

★ Verses range from 23-24  $\mu$  per line

|| - ◡ | - ◡ | - †<sub>M</sub> ◡ †<sub>F</sub> ◡ | - †<sub>M</sub> ◡ †<sub>BD</sub> - ◡ | - × ||

★ Multiple caesurae per line:

- ★ Principle caesura = third foot (second and fourth foot possible)
- ★ Bucolic diaeresis = between fourth and fifth foot
- ★ Pause after line break

★ No restrictions on verses studied due to length

## Vedic resultatives

- (5) utá **médham** † **śṛtapākam**  
 and ritual.offering.ACC.SG.M † cooked.ACC.SG.M  
 pacantu  
 cook.3PL.IMP  
 “and let them cook the ritual offering **cooked**” (RV  
 01.162.10d)

- ★ The **state** of being cooked is achieved as a result of the action indicated by the matrix verb *pac*
- ★ The secondary predicate is prosodically isolated by means of adjacency to a caesura

## Vedic resultatives

- (6) *dādrhāno* *vājram* †  
 hold.PTCP.PERF.MID.NOM.SG.M *Vajra*.ACC.SG.M †  
*īndro* *gābhastyoḥ* ||  
 Indra.NOM.SG.M hand.LOC.DUAL.M ||  
*kṣādmeva* *tigmām* †  
 knife.ACC.SG.N.like sharp.ACC.SG.N †  
*āsanāya* *sām śyad*  
 for.throwing.DAT.SG LP hone.3SG.PRS.INJ  
 “holding the Vajra in (his) hands, Indra honed (it)  
**sharp** like a carving knife” (RV 01.130.04ab)

- ★ The **state** of being sharp is achieved as a result of the action indicated by the matrix verb *śā*
- ★ The secondary predicate is prosodically isolated by means of adjacency to a caesura

# Vedic depictives

- (9) purutrā                    **vṛtró**                    † aśayad  
 in.many.places Vṛtra.NOM.SG.M † lie.3SG.PST  
**vyàstah**  
 fling.apart.PTCP.NOM.SG.M  
 “Vṛtra lay (there), **flung apart** in many places”      (RV  
 1.32.7d)

- ★ The **state** of being flung apart is concurrent with the action indicated by the matrix verb *śay*
- ★ The secondary predicate is prosodically isolated via sentence final/postverbal position

# Homeric resultatives

- (11) àùtàr èpei dē **kukloterès** †  
 but when PTCL made.round.ACC.SG.N †  
**méga** **tókson** éteine  
 great.ACC.SG.N bow.ACC.SG.N stretch.3SG.AOR.ACT  
 “But when he had pulled the great weapon ‘**till it  
 made a circle**’” (Il 04.124)

- ★ The **state** of being made into a circle is achieved as a result of the action indicated by the matrix verb *teíno* (τείνω)
- ★ The secondary predicate is isolated via adjacency to a caesura

## Homeric depictives

- (12) εἰ πάντες                    σὺν νῆυσιν                    †  
 if all.NOM.PL.M with ship.DAT.PL.F †  
 ἀπῆμονες                    † ἔλθον  
 unharmed.NOM.PL.M † come.3PL.AOR.ACT

Ἀχαιοί

Achaean.NOM.PL.M

“whether all the Achaeans came **unharmed** with their ships” (Od 04.487)

- ★ The **state** of being unharmed is concurrent with the action indicated by the matrix verb *erchomai* (ἐρχομαι)
- ★ The secondary predicate is isolated via adjacency to a caesura—it is tucked in between the caesura and bucolic diæresis
  - ★ Given that Homeric lines are built from both the left and the right edges, this is an interesting space prosodically

## Homeric depictives

- (13) ‡ entha **thameiai** || Myrmidonōn  
 ‡ then crowded.NOM.PL.F || Myrmidon.GEN.PL  
 eirunto **nees** takhyn amph'  
 drag.3PL.IMPF.MP boat.NOM.PL fast.ACC.SG.M around  
 Akhilēa  
 Achilles.ACC.SG  
 “then the boats of the Myrmidons were dragged **thick**  
 around quick Achilles” (Il 18.68-69)

- ★ The **state** of being crowded is concurrent with the action indicated by the matrix verb *erúo* (ερύω)
- ★ The secondary predicate is isolated via adjacency to a line break + enjambment—it is tucked in between the bucolic diaresis and the line break

## Homeric depictives

- (14) **ton**                    d'    ōs    oun    enōse  
 he.ACC.SG.M but thus really see.3SG.AOR.ACT  
 podarkēs                dīos                            Achilleus                ||  
 swift.NOM.SG.M divine.NOM.SG.M Achilles.NOM.SG ||  
**gymnon**  
 naked.ACC.SG.M  
 “now as brilliant swift-footed Achilles saw him **naked**”  
 (Il 21.49-50)

- ★ The **state** of being naked is concurrent with the action indicated by the matrix verb *noéo* (*νοέω*)
- ★ The secondary predicate is isolated via enjambment

# Conclusion

- ★ Secondary predicates share in the property of expressing a STAGE-LEVEL property (Carlson 1977; Kratzer et al. 1995)
  - Consequence of the *resP/depP* operator which ensures the STAGE-LEVEL reading across these examples
  
- ★ Secondary predicates are prosodically isolated by means of
  - (i) adjacency to a caesura
  - (ii) or sentence final/post-verbal position
  - (iii) the process of *enjambment*
  - (iv) a combination of (i)-(iii)
  - Consequence of prosodic sensitivity to a boundary which maps to the syntactic-semantic structure

## Conclusion

Secondary predicates in Vedic and Homeric exhibit uniform prosodic, syntactic, and semantic behavior

↔ Prosody reveals complex structure

# Acknowledgements

This project would not be possible without Mark Hale, Kevin Ryan, Kate Davidson, Jeremy Rau, Jay Jasanoff, Dmitri Privoznov, Aljoša Milenković, and the ECO-5 2023 and WISSLR 2023 audiences.

Thank you all for your insightful comments and feedback.  
All mistakes are my own.
