The main empirical area studied in this work concerns inversion structures involving a subject which linearly follows the inflected verb, displaying the word order VS. Seemingly unrelated structures involving reordering of complements (in the sense of Belletti & Shlonsky (1995); B&S, henceforth) will also be considered and will be assumed to involve the same derivational process at work in subject inversion. Both are argued to be instances of clause internal focalization. The term “subject inversion” is thus a purely descriptive label referring to a subset, albeit an important one, of a more general clause internal process.

The descriptive term “inversion”, with reference to subject inversion structures, implicitly capitalizes on the idea that the order VS reverses the canonical order SV(O). However, that subject inversion configurations cannot be derived through a lowering operation moving the preverbal “high” subject to some clause internal position has been assumed ever since Romance subject inversion phenomena have undergone serious examinations in GB terms. Lowering operations of the sort are not admitted in principle as they necessarily produce a violation of the proper binding requirement holding within chains. Without attempting at providing a faithful reconstruction of the details of the different analyses proposed in the literature during the eighties and the nineties, it appears that they all share the idea that the inverted subject is allowed to fill some position in the VP area and that a relation is established with an associate (overt or non-overt) expletive filling the preverbal “high” subject position. It is precisely by virtue of such a relation (sometimes called CHAIN) that the subject is allowed to be found in the low VP area.

The spirit of this traditional GB-style account is essentially preserved in recent treatments of inversion type phenomena developed under minimalist assumptions, with the necessary changes due to the adoption of the VP-internal subject hypothesis (Koopman & Sportiche (1991), Kuroda (1988);cfr.

---

1. Thus preserving the spirit of B&S although various aspects of the implementation, some more crucial than others, differ in various ways as will be pointed in the course of the discussion.
2. Case is often considered the licensing feature held responsible for this distribution of the subject and it is made available through the established relation, with possible differences depending on whether the verb is a transitive/unergative or an unaccusative.
the analysis of the so called T(ransitive)E(xpletive)C(onstruction) of Icelandic, Bobalijk & Jonas (1996), Chomsky (1995)). The account to be proposed below shares with traditional ones the idea that there is no literal inversion process moving the subject from the preverbal subject position to the right, past the inflected verb. However, the existence of a relation with an associate expletive in the preverbal subject position is not considered crucial in the licensing of the inverted/postverbal subject. Such a relation may well exist for independent reasons, and I will actually assume that it does, but the subject, as well as reordered complements in the intended sense, is licensed in situ in a position rather low in the clause functional structure. This position is identified with the specifier of the projection of a clause internal Focus feature.

Let us make the proposal precise starting by considering how low in the clause structure the postverbal subject appears to be. We will then move to the analysis of more complex VPs containing different kinds of complements. The topic of complement reordering will then be taken up and reconsidered within the system developed. Finally, the implications of the proposal will also be considered with respect to structures containing unaccusative verbs.

The data taken into account come from Italian. Some comparative reference will occasionally be made to other Romance languages. The following crucial “reading instruction” holds: unless otherwise specified, all the sentences under investigation here are evaluated with respect to a neutral non-interrupted intonation.4

1. Position and licensing of inverted/postverbal subjects.

1.1 How “low” in the clause structure is the inverted/postverbal subject?

Although the sentences in (1) are not perfect in status, with an interesting difference internal to the paradigm between (1)a,b on the one side and (1)c on the other, they certainly are definitely better than (2):

(1) a ?Capirà completamente Maria will understand completely Maria
    b ?Capirà bene Maria will understand well Maria
    c Capirà tutto Maria will understand everything Maria

(2) a *Capirà Maria completamente will understand Maria completely
    b *Capirà Maria bene

4 It is well known that intonation may “save” or simply change the status of various sentences in interesting ways, some of which will be considered in some detail when relevant to the presented analysis.
Both (1) and (2) are pronounced with normal, non interrupted intonation not implying any sort of “rescuing” strategy through intonation. According to Cinque’s (1998) typology, which I adopt without discussion as a point of departure, the adverbs and the quantifier present in (1) and (2) are those filling the Specs of the lowest different functional projections which build up clause structure. The contrast between (1) and (2) indicates a strong preference for the V Adv S order over the alternative V S Adv.

The sentences in (1) show a kind of “interference” effect which can be held responsible for their slightly degraded status. The effect is interestingly absent in (1)c which indicates that what is at stake here is not just linear interference but some more structured notion. Something can “intervene” between the verb and the postverbal subject provided that certain structural conditions are met. Suppose that the relevant structural conditions requires that a certain “distance” in the tree is present between the Adv/quantifier and the postverbal subject. We can speculate that the quantifier nature of tutto allows it to move to some higher (Spec) position than those occupied by the adverbs in (1)a,b thus becoming more “distant” from the subject in the relevant sense and consequently interfering “less”.

Assuming the VP internal subject hypothesis, and making abstraction from the gradation manifested by (1), the contrast between (1) and (2) allows us to conclude that in subject “inversion” structures either the subject remains in its original VP-internal position or it raises to a very low position in the clause structure, lower than the lowest Spec hosting an adverb.

5 Which should be considered an explicit sign of a change in the syntactic structure.
6 Note that tutto is higher than bene and lower than completamente in Cinque’s clausal map. The quantifier should then be allowed to raise higher than the latter adverb if the proposed interpretation of the contrast is on the right track (See Rizzi (1996) for a similar conclusion). Movement of tutto should be assimilated to the visible syntactic movement of the equivalent French tout and negative rien.

It is frequently suggested that an adjacency requirement operates to the effect that a verb and a postverbal subject should be adjacent to each other and that nothing should intervene between them (Rizzi (1996), Friedemann (1995), see also the observations below. Of course the relevant constraint, usually assimilated to Case adjacency, should be able to capture the subtle distinctions in (1) and to account for the total impossibility of (2) despite the apparent satisfaction of the requirement. Conceivably, as a reviewer suggests, the VP (or bigger constituent) containing V+Adv could be topicalized in the clause internal Topic Phrase to be discussed below or in the clause external one (Rizzi (1997)). If so, these data would not indicate the low location of the inverted (focalized) subject. Although a derivation of this kind could not be excluded in principle, it seems that nothing in the interpretation would force it (contrary to the data to be discussed in 1.4). Hence, a derivation not involving topicalization should also be admitted. As a consequence of that, the contrast between the orders in (1) and (2) can indeed be taken as an explicit indication of the clausal map, with the postverbal subject lower than the lowest adverbs. Note
1.2 “Inversion” as focalization.

If the above conclusion is correct, the question arises as to how the subject is licensed in the low position. A frequently made observation in the literature (cfr. Antinucci & Cinque (1977) for some of the first structured observations in this connection; see also B&S, Zubizarreta (1998) among others for more recent analyses) is that a postverbal subject is focalized, i.e. w.r.t. the “old” vs “new” informational organization of the clause it carries the new information. Pairs like the following illustrate the point:

(3) a Chi è partito / ha parlato?
   who has left/has spoken
 b E’ partito / ha parlato Gianni
   has left/has spoken Gianni
 c #Gianni è partito / ha parlato
   Gianni has left/has spoken

The oddness of (3)c is due to the fact that the subject is not appropriately located: when it is located preverbally it is interpreted as the “old” (“topic”) information, and cannot function as the “new” (“focus”) information. But since the question (3)a precisely concerns the subject, (3)c is not an appropriate answer to it.  

Sharp contrasts along similar lines are provided by the examples in (4):

(4) a (Pronto, chi parla?)
   (hello, who speaks)
 b Parla Gianni
   speaks Gianni
 c *Gianni parla
   Gianni speaks
 d (Chi è?)
   (who is (there))
 e1 Sono io
   am I= it’s me
 2 Sono Gianni
   am Gianni = it’s Gianni
 3 E’ Gianni
   It’s Gianni
 f *Io/Gianni sono/è
   I/Gianni am/is

(4)b and (4)e1,2,3 illustrate the typical sentences utilized in answering (the often implicit question of) phone calls or a (possibly implicit) request of identification in typical situations, e.g. after knocking at somebody’s door. The word order in this case is consistently and only VS. Having the subject in

Furthermore, that a derivation involving topicalization would not easily be able to draw the relevant distinction in the hierarchy of grammaticality judgments.

7 In the same vein, consider the further fact that (3)b can also be the appropriate answer to a question concerning the clause as a whole, as cosa è successo?: or can be pronounced in a so called “out of the blue” context, in both cases with no presupposition concerning the subject. (3)c would not be equally appropriate in similar contexts.
preverbal position gives a sharply ungrammatical result in these situations, as (4)c,f indicate. In (4) exactly as in (3), the wellformed sentences have the subject as the new information focus. It then seems plausible to hypothesize that focalization plays the crucial role in the licensing of the (low) postverbal subject.

We pointed out in 1.1 that the postverbal subject fills a very low position in the clause. A natural hypothesis would be to assume that it is as low as its original VP-internal position. If this is the case the obvious question arises as to how it is licensed in such low position. It is currently assumed that Case is the (morpho)syntactic feature that is crucial in the licensing of overt noun phrases. Unless we allow nominative Case to be accessible to the VP internal subject position, possibly through the relation with an associate expletive, it is clear that Case is not available VP internally for the postverbal subject. If we want to try to maintain Case assignment/checking as local a process as possible, as seems desirable, we are in fact forced to conclude that no Case is available for the subject in its original VP internal position. As we have just determined that the postverbal subject fills a very low position in the clause structure we seem to be forced to conclude that this position cannot coincide with the VP internal original one as the subject could not be licensed through Case there. Furthermore, given current assumptions on the distribution of functional projections in the clausal architecture, in particular of those responsible for Case assignment/checking, it seems that no other (nominative) Case position is likely to be available for the subject in the very low area where it is found. The question of the licensing of the postverbal subject thus remains open.

Suppose that not Case but Focus plays the role of the licenser of the postverbal subject. From the interpretive/informational point of view the hypothesis seems entirely justified. But what is the status of Focus under this view? To make the proposal technically more precise I will assume that Focus is a syntactic feature heading a functional projection in the clause structure, thus creating a regular checking configuration. Under this proposal, the syntactic feature in question has licensing abilities. In a broader perspective, we can assume that Case is not the only licenser of overt DPs in the clause. It is probably the most typical/widespread one, but others are available as well. Focus is one of them in this view.

Possibly, the judgement is so sharp because these “answers” have become figées expressions. Furthermore, the impossibility of (4)f, is also due to the fact that a predicate is necessary in copular sentences. See Moro (1997) for a discussion of similar data where the good cases are assumed to be “inverse copular” sentences containing a low clause internal subject. An analysis interestingly convergent with the one to be developed here.

See Cardinaletti (1998) where data like those in (1), (2) are also presented and precisely this assumption is made.

Beside subject inversion structures, no other cases appear to require a similar kind of non-local assignment/realization. See Belletti (1988), Lasnik (1992, 1995). See also the discussion in footnote 16.
The proposal that a Focus Phrase is present in the clause has been made various times in the recent literature on functional projections. Typically, the FocusP is located in the left periphery of the clause as in Rizzi (1997), Puskas (1996), Brody (1990). I assume that such a position exists. It is the one hosting “contrastive” focus in Italian:

(5) Il LIBRO ho letto, non il giornale
    THE BOOK I have read, not the newspaper

As in the analysis developed in B&S, I take the FocusP hosting postverbal subjects to be a different one, as is clear from the distribution, and to be clause internal. Differently from the left peripheral focus position, the clause internal one is not associated with any special contrastive intonation: no contrast is implied, as (3) and (4) show. Indeed, the pragmatics of the two focus positions is quite different. A left peripheral focus cannot function as an appropriate answer to a pure question of information. (5) cannot answer a question like (6).

(6) Che cosa hai letto?
    What have you read?

Nor can (7)b answer a question like (3)a above, repeated in (7)a:

(7) a Chi è partito / ha parlato ?
    Who has left/has spoken?
    b (*) GIANNI è partito/ha parlato
    GIANNI has left/has spoken

Where (7)b is pronounced with the typical intonation associated with left peripheral focus in Italian, indicated with capital letters.

Given the considerations prompted by the respective position of low adverbs and postverbal subjects, we are led to conclude that the clause internal FocusP is very low in the clause. Assume it is the first functional projection above VP:

(8)   FocusP
       1
       Foc’
       1
       Foc   VP

11 For a distinction between peripheral (often contrastive) focus and new information focus see Kiss (1998), where only the first type is associated with a designated syntactic head.
12 A proposal to be refined below (cfr. 1.4).
The subject moves to the specifier of FocusP and the Verb raises higher up producing the order VS.\textsuperscript{13} Within this approach Focus has no special status: it is a feature which gives rise to a regular checking configuration. Its licensing property does not need to appeal to special external conventions. The only hypothesis needed is the one attributing to the Focus feature a licensing ability for overt DPs comparable to that of a Case feature and, as such, possibly alternative to it.\textsuperscript{14}

In standard Italian, in subject inversion sentences the verb agrees with the potverbal subject and the latter carries nominative Case. This is overtly visible in examples like (9):

(9) Sono arrivata io  
\hspace{1cm} have arrived I

A fairly traditional interpretation of this kind of data\textsuperscript{15} might consist in assuming that a relation between the postverbal subject and the preverbal subject position is established, possibly with a non overt expletive filling the latter position (the CHAIN relation referred to above), and that all pronounceable features in the chain are (by necessity) realized on the “overt” elements. They are then realized in the inflectional affixes and in the morphological Case of the postverbal subject. The chain relation would then be held responsible for both Case and agreement. As for the presence of nominative, however, an account of this kind appears to be insufficiently general and should be refined, in order to incorporate cases like (10):

(10) Penso di [ - parlare io a Gianni]  
\hspace{1cm} (I) think to speak I to Gianni

In (10) the relation should be established between the postverbal “io” and the embedded preverbal subject position of the infinitival clause. But no association with nominative Case is granted here through this relation as null Case is the only Case related to the infinitival subject position (Chomsky & Lasnik (1993)). Moreover, null Case is incompatible with overt elements. Suppose instead that the postverbal embedded subject “io” is licensed is situ within the clause internal Focus phrase.\textsuperscript{16} Its

\textsuperscript{13}Differently from B&S, I now assume that FocusP always displays a regular left branching Spec position. This eliminates one unsatisfactory aspect of that analysis which stipulated a parametrical difference between languages with respect to the direction of the location of the specifier of FocusP while keeping its fundamental leading intuition. I believe that the comparative insights of B&S’s analysis can be preserved within the set of new assumptions developed here. I will not attempt a close examination of the comparative issue here.

\textsuperscript{14}Case and Focus are not necessarily alternative licensing features. They can combine with no clash being created: the clearest case is probably that of peripheral focus (under a movement analysis of focalization).

\textsuperscript{15}The “standard” view in GB, cfr. Rizzi (1982), Safir (1984), Burzio (1986). See Alexiadou & Anagnostopoulou (1998) for a recent different view which does not imply presence of a non-overt expletive in the preverbal subject position (of null subject languages).

\textsuperscript{16}Its status as “new information” is confirmed by the following question-answer pairs:

(i) A: Chi pensa di parlare a Gianni?  
\hspace{1cm} Who thinks to speak to Gianni?  
B: Penso di parlare io a Gianni (=10))
realization as a first person singular can be attributed to the relation with the preverbal subject, PRO, controlled by the matrix subject.\textsuperscript{17} Its realization as a nominative must be due to the independent necessity of choosing a morphological realization for a pronounceable overt element, if available. Under this view, nominative would count as a default realization. If an account along these lines is tenable, examples like (10) illustrate a situation where Case and Focus are dissociated. The same account could then naturally extend to examples like (9) where nominative on the postverbal pronoun should not necessarily be interpreted as a consequence of the established relation with the preverbal subject position.\textsuperscript{18} Examples like (11) following complete the paradigm with cases where both the preverbal subject and the postverbal pronominal subject are overt:

(11) Gianni parlerà lui con Maria
    Gianni will speak he with Maria

In these examples, the postverbal pronominal subject is usually interpreted as having a strengthening function, often called “emphatic”. Note that if the postverbal pronominal subject is licensed in FocusP, a direct explanation is provided as to why it must necessarily be realized as a strong pronoun. The weak pronoun version of the third person singular pronoun “egli” is totally excluded in these constructions:

(12) *Gianni parlerà egli con Maria
    Gianni will speak he with Maria

If weak pronouns are “deficient” in Cardinaletti & Starke’s (1994) sense, it is natural that they are incompatible with a saliency feature like Focus. Note finally that the detectable anaphoric behavior of the emphatic postverbal subject pronoun in (11) could be analyzed along similar lines as those assumed for the “Floated quantifiers” (FQ) phenomenon in Sportiche (1988). It could be an indirect consequence

<table>
<thead>
<tr>
<th>(I)</th>
<th>think to speak I to Gianni</th>
</tr>
</thead>
<tbody>
<tr>
<td>B': Penso di parlarci io</td>
<td></td>
</tr>
<tr>
<td>(I)</td>
<td>think to speak to him I</td>
</tr>
</tbody>
</table>

“A Gianni” in B could fill the low Topic position to be introduced in 1.4 below.

Note that no “long distance agreement” of the type advocated in Chomsky (1998) could be established in (10) between the matrix T and the postverbal pronoun in the embedded clause and held responsible for both Case on the pronoun and agreement, given the control status of the infinitival clause. Cases like (10) are thus crucially different from raising cases like There was a man in the room or, possibly, Sembrano essere arrivati molti ragazzi (there seem to have arrived many children), discussed in Chomsky (1998) and in previous literature on inversion (see references quoted in footnote 3). Thanks to E. Raposo and an anonymous reviewer for implicitly raising the issue of a comparison between the two types of structures. It should also be noted that structures like those in (10) do not necessarily involve agreement between the matrix subject and the embedded nominative pronoun as in cases like (ii) following, thus confirming the conclusion that “long distance agreement” is not the relevant notion here anyway:

(ii) Maria mi ha chiesto [di parlare io a Gianni]
    Maria asked me to speak I to Gianni

\textsuperscript{17} Under this analysis PRO is then an argumental subject, not an expletive PRO. A welcome conclusion, given the often observed lack of an expletive PRO in infinitival clauses which examples like the following illustrate:

<table>
<thead>
<tr>
<th>(i)</th>
<th>*?E’ difficile rispondere senza PRO sembrare impossibile</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>It is difficult to answer without seeming impossible</td>
</tr>
<tr>
<td>(ii)</td>
<td>* Maria è partita senza PRO essere certo che fosse necessario</td>
</tr>
<tr>
<td></td>
<td>Maria has left without being certain that it was necessary</td>
</tr>
</tbody>
</table>

\textsuperscript{18} Which should be held responsible for verbal agreement only.
of the movement of a portion of the noun phrase containing the lexical subject to some preverbal subject position, leaving the DP portion containing an explicit determiner behind. The latter being licensed through focus, it necessarily corresponds to the strong version of the pronoun, as discussed above.\(^\text{19}\)

1.3 \(V S XP (V S O, V S PP, V S CP)\)

Once we assume that the postverbal subject is licensed in the specifier of the Focus phrase, the natural question which arises is what happens if a complement of \(V\) is also present in the VP. Let us consider three cases in turn: a) the complement is a direct object (O, henceforth); b) the complement is a prepositional object (PP); c) the complement is a clause (CP).

1.3.1 \(V S O (a)\)

Once \(S\) moves to the specifier of FocusP and \(V\) moves to some inflectional head above it, a direct object \(O\) would still need to be licensed in some functional Spec position. The specifier of FocusP is filled by the subject, hence \(O\) could (only) be licensed through Case. In order to perform Case checking, it should move to the Spec of its Case checking projection, which is located above the Focus Phrase, this being the lowest functional projection of the clause by hypothesis. I assume that such crossing of the object over the subject is not allowed due to Relativized Minimality (RM). I also assume that in clauses with a preverbal subject the same problem does not arise since the subject continues its movement and in the final representation it ends up higher than the object. Indeed, the relevant constraint requires that the initial hierarchical order of constituents is preserved in the final structure.\(^\text{20}\)

\(^{19}\) Contrary to emphatic pronouns, a FQ does not need licensing in Focus phrase. Whence the different status of FQ and emphatic pronouns with respect to focalization. An emphatic function is also associated with the overt embedded pronoun of (10). The same analysis should account for the (apparent) anaphoric behavior of the personal pronoun “io”. Here the moved portion of the noun phrase should correspond to a non overt PRO. The fact that the emphatic pronoun can be realized as different persons and numbers suggests that it corresponds to various functional positions of the DP. Thus, the proposal hinted at in the text of simply calling it “D” must be viewed as a simplification.

Note that for the proposed account to work, the noun phrase must be attributed a sufficiently rich internal structure in order to allow for more than one D type position. This is necessary in order to derive cases like (i):

(i) \(\text{Il responsabile parlerà lui della situazione}\)

The responsible person will speak he of the situation

where both the article and the strong emphatic pronoun are present.

Under the analysis developed in the text, the emphatic constructions share crucial structural properties with clitic doubling constructions (Belletti (forthcoming), Uriagereka (1995), Sportiche (1996)). This is also true from the point of view of the \(\theta\) roles involved, as in both cases one single \(\theta\) role is shared by the two related elements: the lexical noun phrase and the pronoun. The emphatic construction is, in a sense, the “mirror image” of clitic doubling. In clitic doubling the moved portion is the D portion, while it is the portion containing the lexical noun phrase in the emphatic construction. I leave these considerations for further development.

\(^{20}\) No similar problem arises if movement involves a QP rather than a direct object DP as facts involving the quantifier “tutto” like those in (1)c above indicate. The different categorial status should be at the source of this difference. See Watanabe (1992); Haegeman (1993) on the operation of the constraint, which appears to also be generally respected in “object shift” constructions (Vikner (1995)).
Note that the excluded movement of the direct object to the specifier of its Case checking projection, would yield the word order: VOS. This order is not a felicitous one as is illustrated by examples like (13).

(13) a ??Capirà il problema Gianni
   will understand the problem Gianni
   b ??Ha spedito la lettera Maria
   has sent the letter Maria
   c ??Ha chiamato Maria Gianni
   has called Maria Gianni

The VOS order has often been regarded as violating an adjacency constraint requiring that no material interrupt the V S sequence. The status of this adjacency requirement has been assimilated to Case adjacency (Rizzi (1996) and related works, among which B&S, Friedeman (1995)) assuming that the postverbal subject could be directly Case marked in the low/inverted position under government from a nominative Case assigner functional head, sometimes identified with T. However, under a more recent conception of clause structure with a richer and more articulated functional skeleton than the original analysis à la Pollock (1989), it does not seem very likely that the nominative Case assigner (assume it to be T) could really be the functional head closest to the low/inverted subject. Furthermore, the Case adjacency analysis does not make one expect that a VSO sequence should be judged as completely impossible in Italian, in fact much worse than VOS, as we are going to discuss at some length below.

(14) a *Capirà Gianni il problema
    will understand Gianni the problem
    b *Ha spedito Maria la lettera
    has sent Maria the letter

As in all the cases throughout, the reported judgments refer to the sentences pronounced with continuous, non interrupts, normal intonation. It would seem that, all things being equal, if Case adjacency were the relevant notion, (14) should be more acceptable than (13), possibly totally acceptable (with the qualification of footnote 22), contrary to fact.

---

21 The two “??” in (13) refer to the sentence pronounced with normal, non interrupted intonation. The sentences have a reading where VO is taken as the given/presupposed information, related to a slightly different intonation with VO pronounced as a unit, which makes them acceptable. We will address this possible reading in the following discussion. If cliticization of O takes place, the output is straightforwardly wellformed:

(i) Lo capirà Gianni
    It+will understand Gianni

I propose that, if cliticization starts out as head movement of the clitic (D) from the object Case checking specifier position (Belletti (forthcoming)), (i) would not violate RM under the assumption that the clitic DP move to the object Case checking specifier from the specifier of a clause internal Topic phrase as in the analysis of VOS discussed in 1.4, thus not directly crossing over the subject. Movement of the object DP from the specifier of the Topic phrase should be assumed anyway as Case checking of the object should be performed in VOS.

22 Of course, under the assumption that O could be licensed in this structure. A matter to which we will return shortly.
It is natural at this point to raise the following question: what does the proposed analysis have to say on the detected impossibility of the VSO order in Italian? In fact, within this analysis VSO cannot be generated altogether: with S licensed in the specifier of the Focus phrase, O is blocked within VP where no licenser is present. Hence the structure is eliminated. Thus, VOS and VSO are ruled out by essentially the same reason: impossibility of properly licensing both S and O in the low area of the clause. Note, for completeness, that if we wanted to license O in the specifier of the Focus phrase leaving the subject VP internal, yielding VOS once again, we would be left, this time, with S licensed neither through Case nor through Focus, hence unlicensed, expectedly an unacceptable outcome.23

Speakers tend to attribute a slightly less marginal status to the VOS order than to order VSO in Italian, provided that a particular intonation is utilized (footnote 21) and certain pragmatic conditions are met. On the other hand, it is well known that there are languages, in particular languages of the Romance family, e.g. Spanish (Zubizarreta (1998), Ordóñez (1997)) and Romanian (Motapanyane (1995)), which appear to allow for the order VSO rather freely. I delay after discussion of points b) and c) some reflections on the possible reasons behind these contrasts.

1.3.2 V S PP (b)
Let us now consider the case where the VP internal complement of V is a prepositional object. Suppose that S is licensed in the specifier of the Focus phrase and PP remains in the VP internal position. In combination with verb movement this yields the order VSPP. Recall that in the case of a direct object this order yields an impossible output in Italian since, as we have just seen, the direct object O cannot be licensed VP internally (nor can S with O in the specifier of FocusP). It appears that the situation is remarkably different in case the object is a PP. Consider the following quasi-minimal pairs in this respect:

(15) a (?) Ha telefonato Maria al giornale
    has phoned Maria to the newspaper
   b *Ha comprato Maria il giornale
    has bought Maria the newspaper

   c (?) Ha parlato uno studente col direttore
    has spoken a student to the director
   d *Ha corrotto uno studente il direttore
    has bribed a student the director

   e (?) Ha sparato il bandito al carabiniere
    has shot the gangster at the policeman

23 RM would possibly be violated here as well. Although it might be suggested that if S does not move the violation of RM would not arise in the same way. See in this connection VOS in object shift, with S indefinite, hence, possibly, in its VP internal base position.
Why should this difference exist? If the proposed interpretation of the reasons ruling out VSO is on the right track, the contrast between direct objects and prepositional objects naturally suggests the following interpretation. Assume that S fills the specifier of the Focus projection. Assume that, differently from DPs, PPs are autonomously licensed and do not need move to a VP external position. Rather, PPs are licensed in situ. If this is the case, the V S PP order is obtained by leaving the PP in its base VP internal position. The output is expected to be acceptable.

Why should PPs be licensed in situ? An obvious reason suggests itself. Note that, in fact, only DP arguments need licensing (usually performed through Case). Thus, a PP can be taken to contain the licenser of its DP complement internal to its own projection. Suppose that such licenser is recognized in the preposition itself. We could execute the idea by assuming that checking of the P feature is done through movement of the DP complement to the specifier of PP (or through movement of some relevant feature, (Chomsky (1995), or through the establishment of an agreement relation in Chomsky’s (1998) sense). This line of analysis captures a fact often observed in both traditional accounts and more theoretically oriented ones according to which prepositions “play the role” of Case.

1.3.3 V S CP (c)
In the generative literature, clauses have occasionally been assumed not to need Case.

24 The variety of subjects utilized, definite, indefinite, proper name, is meant to indicate that the contrast is detectable independently from this variable.

As pointed out in Kayne & Pollock (1978) and as is discussed in detail in Friedemann (1995), VSPP is also a possible order in French stylistic inversion constructions such as (i) (see Friedemann (1995) for the discussion of subtle gradations in acceptability judgements in these structures; see also Kampers-Manhe (1998) for restrictions on VSPP in subjunctive stylistic inversion contexts):

(i) Qu’a dit Jean au jardinier?
What has said Jean to the gardener

While both VSO and VOS are excluded in the same constructions.

Although the judgement is fairly subtle, VSPP tends to be more acceptable than VSO also in embedded control infinitival clauses containing an emphatic (non-contrastive) nominative pronoun of the kind discussed in (10):

(ii) a (??) Quello studente/ - ha/ho deciso [ di parlare lui/io col direttore]
that student/(I) decided to talk he/I to the director

b ??Quello studente/ - ha/ho deciso [di corrompere lui/io il direttore]
that student/(I) decided to bribe he/I the director

The judgements refer to the sentences pronounced with continuous, neutral intonation (in particular, with no “marginalization” of the direct object in the sense of Antinucci & Cinque (1977), which would make both sentences perfectly acceptable).

25 A stronger requirement has been proposed by Stowell (1981), namely that clauses “resist” Case. Given the framework in which the proposal was framed where Case was taken to be assigned under government in the complement position, Stowell also assumed that clauses are necessarily extraposed. The analysis required supplementary assumptions to distinguish between complement clauses and adjunct clauses which display very different behaviors, most notably with respect to
remain *in situ*, in the VP internal complement position. Assume that this is what happens. We then expect that the order V S CP should be a possible one, with S in the specifier of the Focus projection and the CP complement VP internal, much as in the case of V S PP. This is indeed what we find in various cases:

(16) a Ha detto la mamma che ha telefonato Gianni
    has said the mother that has telephoned Gianni
    b Ha detto la mamma di andare a letto
    has said the mother to go to bed

It should be pointed out, however, that the order V S CP is not felicitous with all verbal choices, thus suggesting that other factors are involved in making the order appropriate. Examples like those in (17) provide a sample of cases where the order V S CP, pronounced with the usual continuous intonation, is bizarre and essentially unacceptable:

(17) a *?Ha cominciato Gianni a non capire più niente
    has started Gianni to not understand anything anymore
    b *?Ha pensato/pensa la mamma che Gianni non capisca più niente
    has thought/thinks the mother that Gianni doesn’t understand anything anymore
    c *?Crede Maria che Gianni sia partito
    believes Maria that Gianni has left
    d *?Ha deciso Gianni di parlare con Maria
    has decided Gianni to speak with Maria

I leave open here the development of an accurate hypothesis on the possible reasons of the deviance of sentences like (17).  

To the extent that the sentences become acceptable with the alternative order V CP S, they could be amenable to the same analysis as the possible V O S orders to be discussed in 1.4 below:

(i) a Ha cominciato a non capire più niente Gianni
    has started to not understand anything anymore Gianni
    b Ha pensato/pensa che Gianni non capisca più niente la mamma
    has thought/thinks that Gianni doesn’t understand anything anymore the mother
    c Crede che Gianni sia partito Maria
    believes that Gianni has left Maria
    d Ha deciso di parlare con Maria Gianni
    has decided to speak with Maria Gianni

Note furthermore the following interesting contrast:

(ii) *?Ha deciso di parlare Gianni con Mario
    has decided to speak Gianni with Mario

(iii) Gianni ha deciso di parlare lui con Mario
    Gianni has decided to speak he with Mario

Judgements refer to situations where no special (contrastive) intonation is associated to “Gianni” or “lui”. (ii) should be analyzed in the way discussed in 1.2 in the text, with the pronoun licensed in the specifier of the embedded Focus phrase “doubling” the PRO raised to the subject position of the infinitival. A similar analysis could not be extended to (i) as PRO and “Gianni” would plausibly compete for the same position within the original DP. (ii) contrasts with (iv):

(iv) [ha deciso di PRO parlare t] GIANNI con Mario
    has decided to speak GIANNI with Mario
Summarizing, I have proposed that the VS order is obtained through movement of the subject into the specifier of a clause internal Focus functional projection with the verb filling some higher functional head. All other things being equal, other arguments of the verb are allowed to linearly follow S only if they can remain in their (original) VP internal complement position. This possibility is available to PPs and CPs but not to direct object DPs. This rules out the VSO order, with O a direct object DP. If O raises out of VP to its Case checking position it necessarily crosses over the low subject in the specifier of the Focus phrase giving rise to an illegitimate derivation, because of RM (and since the subject does not raise further up). This rules out VOS. All the judgments refer to the sentences pronounced with normal, non interrupted intonation.

1.4 More on VOS.
We are now ready to take up the issue left open above as to why the speakers’ intuitions give VOS as a word order slightly more acceptable than VSO. I have reproduced this intuition by attributing two “??” to the former order and a straight “*” to the latter. Nevertheless, the analysis developed above rules out both VOS and VSO with no attempt to express a difference. Indeed, I would like to suggest that no real “grammatical” difference is at stake here; rather, interfering factors account for the subtle differentiation made by speakers. I will now try to make these factors explicit within the terms of the general analysis proposed.

One context in which VOS appears to be a possible (although somewhat redundant and slightly unnatural) word order is the one where it shows up as the answer to a question where the whole “given” information is repeated, this being precisely constituted by V and O. Consider in this respect the following question-answer pairs:

(18)  A: Chi ha capito il problema?
      Who has understood the problem?
      B: Ha capito il problema Gianni
          Has understood the problem Gianni

      C: Chi spedirà la lettera?
          Who will send the letter
      D: Spedirà la lettera Maria

with the preposed portion of the clause topicalized in the clause peripheral position, “Gianni” contrastively focalized in the clause peripheral Focus phrase, and the PP “marginalized” in a clause internal Topic position (Belletti (1999); in the simplified representation “t” stands for the original location of the PP).

27 A similar judgement apply to sentences where the VP contains a PP complement displaying the order V PP S:

(i)  A: Chi ha parlato con Maria?
    Who has spoken with Maria?
    B: Ha parlato con Maria Gianni
Will send the letter Maria

Of course the most natural answers to questions (18)A, C would have O expressed in the form of a pronoun:

(19)  B’ L’ha capito Gianni
      It+has understood Gianni
      D’ La spedirà Maria
      It+will send Maria

More natural examples manifesting an acceptable VOS order are typically found in special contexts belonging to a particular register such as that of live radio/TV reports of, e.g., football matches. Some examples are given in (20):

(20)  a Mette la palla sul dischetto del rigore Ronaldo
      puts the ball on the penalty point Ronaldo
  b Protegge l’uscita di Marchegiani Nesta
      protects Marchegiani’s coming out Nesta

Note that sentences of this kind are only possible if the VO part of the clause immediately preceding S is interpretable as describing a member of a set of prototypical situations (predicates) in the context of a (football) match. As soon as VO is not interpretable in this way, VOS becomes once again (essentially) unacceptable (cfr. (13)):

(21)  a ??Spinge l’arbitro Ronaldo
      pushes the referee Ronaldo
  b ??Ferisce il guardialinee Nesta
      hurts the linesman Nesta

We can conclude that what the acceptable sentences with the order VOS have in common is the fact of introducing a V O sequence which constitutes the “given” part of the information provided by the sentence.

Suppose that this only possible interpretation is associated with the following syntactic analysis: the “given” constituent containing V+O moves to the specifier position of a Topic projection. A position of

---

28 Given the appropriate set of presuppositions, the following would also be more natural answers to the questions in (18)A, C:

(i) Ha capito il problema solo Gianni
    Has understood the problem only Gianni
(ii) Spedirà la lettera proprio Maria
    Will send the letter precisely Maria

Where “solo” and “proprio” act as constituent-focalizers thus leaving as a “topic”/”given” information everything which precedes them.

29 Thanks to L.Rizzi for bringing these quite typical data to my attention in this connection.
this type is assumed in the analysis of the left periphery of Rizzi (1997) where it is located immediately above the clause external Focus projection. Another Topic projection is located right under Focus which is thus surrounded by two Topic phrases. Let us make the proposal that, much as for the peripheral, clause external projections, also the clause internal ones involve not only a Focus Projection (above VP), but also a Topic projection right above it and one right under it.\(^3\) We can assume that the moved constituent is the XP (VP?) containing the trace of the subject moved to the specifier of the Focus phrase.\(^3\) As in the analysis proposed by Ordóñez (1997), this topicalization can be considered the analog of the process taking place in the Germanic languages and come to be known as “remnant topicalization”, although I am assuming that the process taking place here is clause internal. I then suggest that the reason why the order VOS tends not to be totally excluded by speakers is because of interference with this possible topicalized construction.\(^3\)

In the proposed analysis I have assumed that the subject fills the clause internal specifier of the Focus projection. Notice that, so far, we have considered sentences like (18)B,D as pronounced with regular intonation not involving any particular stress on any constituent. It is clear to any speaker of Italian that a special stress on the postverbal subject makes the VOS order uncontroversially acceptable. This stress is contrastive stress:

\[
\begin{align*}
(a) & \quad \text{Ha capito il problema GIANNI (non tutta la classe)} \\
& \quad \text{has understood the problem GIANNI (not the whole class)} \\
(b) & \quad \text{Ha spedito la lettera MARIA (non sua sorella)} \\
& \quad \text{has sent the letter MARIA (not her sister)}
\end{align*}
\]

The remnant VP preceding S is still interpreted as the Topic; the Focus of the clause is the contrastively stressed subject. Note now that also a preverbal contrastively stressed subject count as Focus:

\[
\begin{align*}
(a) & \quad \text{GIANNI ha capito il problema (non tutta la classe)} \\
& \quad \text{GIANNI has understood the problem (not the whole class)} \\
(b) & \quad \text{MARIÀ ha spedito la lettera (non sua sorella)} \\
& \quad \text{MARIÀ has sent the letter (not her sister)}
\end{align*}
\]

\(^3\) The role of the latter is analyzed in Belletti (1999) in the context of the discussion of the so called process of “marginalization” (Antinucci & Cinque (1977)).

\(^3\) An analysis along similar lines is proposed in Ordóñez (1997) for similar data. However, contrary to Ordóñez, I assume that the process is clause internal. I leave the clause external Focus (and the related Topics) as the designated position for contrastive focus. See also the discussion below. For the idea of a clause internal Topic phrase position, see the recent analysis of Right dislocation proposed by Cecchetto (1998).

\(^3\) I must consequently assume that the violation of the Proper binding requirement (induced by the subject trace) is “rescued” in the same way as the same violation of “remnant topicalization” structures (through “reconstruction”). It can furthermore be assumed that O can then move out of the Topic phrase to reach its Case checking specifier. See footnote 21 for related discussion. V could also move out to perform checking of its \(\otimes\) features.
A reasonable analysis of clauses like (23) locates the subject in the clause external specifier of the Focus phrase, the same position filled by the focalized constituents in (24)a,b, the same position which, according to Rizzi (1997), also hosts wh interrogative operators33((24)c):

(24)  a  IL PROBLEMA Gianni ha capito (non l’equazione)  
THE PROBLEM Gianni has understood (not the equation)  
b LA LETTERA Maria ha spedito (non il pacco)  
THE LETTER Maria has sent (not the parcel)  
c Che cosa ha capito Gianni?  
What has understood Gianni?

The proposed analysis for the sentences in (23), thus assumes that the preverbal subject does not fill the preverbal clause internal subject position34, but it is rather clause external in the specifier of the Focus phrase. If this analysis seems reasonable and coherent with current assumptions, I would suggest that one could extend exactly the same analysis to the sentences in (22). Hence, when contrastively stressed, the postverbal subject of these clauses should have the subject in the left peripheral specifier position of the Focus projection. The remnant VP would fill the specifier of the Topic projection above the clause external Focus phrase. I assume that this is the analysis of (23).35

1.5 What could allow for VSO in some Romance languages.

Several studies on postverbal subjects in Spanish have repeatedly indicated that VSO is a possible word order in this language. See the discussions in Zubizarreta (1998), Ordóñez (1997), in particular. VSO is also a possible word order in Romanian as illustrated in Motapanyane (1995):

(25)  a  Todos los días compra Juan el diario     (Zubizarreta (1998))
Every day buys Juan the newspaper  
b  Espero que te devuelva Juan el libro        (Ordóñez (1997))
I hope that cl-you return Juan the book  
(I hope that Juan returns the book to you)  
c  O invita cam des Ion pe fata acesta            (Motapanyane (1995))
her invites quite often Ion ‘pe’ girl the-that
(Ion invites that girl quite often)

33 An updating and refinement of Chomsky’s (1977) analysis of various “left peripheral” constructions in terms of the unifying process of wh-movement.

34 Rather “one” of the clause internal positions available to preverbal subjects, see Cardinaletti (1997) and realted work in the same direction, according to which there are at least two, possibly more, positions available to preverbal subjects, each specialized for different interpretations and hosting different kinds of subjects.

35 Ordóñez’ analysis is then adopted for these cases only. I leave open for now a close discussion of the question whether the clause external Focus projection is the only one designated for assignment of contrastive stress or whether, in some cases, also the clause internal one would qualify. What is important to underscore is that only the clause internal Focus projection is compatible with regular stress/intonation and it is the site of simple new information focus; the clause external one is compatible with contrastive stress. What remains to be seen is whether the clause internal Focus projection can also be compatible with constrastive stress and, if yes, in what circumstances. For the time being, I make the strongest assumption that only the clause external Focus projection is specialized for contrast, as in the discussion in the text.
It appears that, differently from the situation in Italian, a postverbal subject in VSO order is not (or not necessarily) the new information focus of the clause in languages like Spanish. Suppose that this could be interpreted as indicating that it fills a position different from the specifier of the clause internal Focus projection. The question then arises as to what makes a further (higher) position available for a postverbal subject in Spanish but not in Italian. If Focus is not the licenser of the postverbal subject there must be another licenser. The only suggestion I can make here essentially adopts and rephrases the proposal made by Zubizarreta. Assume the licenser to be Case. Languages like Spanish would dispose of an extra Case position, different from the preverbal one(s), where (nominative) Case can be assigned/checked. This position should be relatively high in the clause, higher than the VP external position where the direct object is licensed. Hence, both S and O would be licensed in Spanish and similar languages VSO clauses through Case.

Why doesn’t Italian have this extra Case position? Does this difference between the two kinds of languages correlate with some other difference? One could speculate that this is probably the case if another frequently pointed out difference between the two kinds of languages is considered, namely the fact that the finite verb seems to raise higher in Italian than in Spanish, taking the position of equivalent adverb classes to be revealing in this respect (see Motapanyane (1995) on Romanian). Consider the contrast between Spanish and Italian in (26):

(26) a La vijeita apenas/siempre/nunca puede leer los periodicos (Suñer (1994))
the dear old lady barely/always/never can read the newspaper
b *?La vecchietta appena/sempre/mai può leggere i giornali
the old lady barely/always/never can read the newspaper

Of course, what remains to be understood is how a lower Verb could activate a further Case position below it. I leave this question open and these remarks at this speculative stage here.

2. Multiple complements reordering and subject inversion.
Let us assume a VP internal structure like the one in (27):

---

36 Possibly, this latter position is accessible to the direct object.
37 The processes involved are assimilated to those at work in VSO languages in general (cfr. Semitic, Irish..).
38 In the spirit of this line of account, the same DP position could be available and possibly host the subject in all languages. The difference should be whether the DP is allowed to remain in such a position, if it is licensed there or not. It would be licensed in Spanish and not on Italian. I speculate that agreement with the closest governing V could be the relevant factor. As pointed out in Picallo (1998) (see also Solà (1992)) VSO is excluded in Catalan (Picallo’s diacritics):
(i) (?)*Fullejava en Joan el diari
leafed Joan through the newspaper
As Catalan displays an order of adverbs closer to Spanish than to Italian, this seems to suggest that a “shorter V-movement” should at most be considered a necessary but not a sufficient condition for the licensing of the extra “low” subject position anyway.
Consider now the following sentences, involving a verb like *dare* which takes both a direct and an indirect prepositional object: beside the “unmarked”/basic V O PP order, also the V PP O order is admitted, as discussed in detail in B&S:

(28) a *Ho dato un libro a Gianni*  
    (I) have given a book to Gianni  
    b *Ho dato a Gianni un libro*  
    (I) have given to Gianni a book

B&S provide a rich list of multiple complement verbs, all manifesting the same paradigm, with both orders of complements possible and the order V O PP normally considered the “unmarked”/basic one. Note now that both orders are perfectly acceptable when also a preverbal overt subject is present:

(29) a *Gianni ha dato un libro a Maria*  
    Gianni has given a book to Maria  
    b *Gianni ha dato a Maria un libro*  
    Gianni has given to Maria a book

As observed in B&S, complement reordering interacts in interesting ways with subject inversion. The order V O PP S is (marginally) acceptable with the only interpretation having V O PP, the “remnant” VP, as the “given” information and the postverbal subject as the “new” one. Consider the sentences in (30) in this respect (cfr: B&S exx. (24)a,c):

Contrary to B&S, I make the assumption that, as in the uniform base of Kayne (1994), the direction of the location of the Specs is uniformly on the left of the head projection. I have made the same change as for the location of the Specifier of the Focus projection. See also footnote 13.

In B&S the hierarchy of the arguments has the PP in the Spec of the low VP and O in its complement position. If this is the case, the assumption must be made that RM is not violated by the crossing of O over the PP in its movement to the (Case) checking position. Plausibly, a PP would not interfere with respect to the movement of a DP. The constraint on the preservation of the hierarchy of arguments might be more problematic, though. This suggests that a more appropriate representation should have O in the Spec of the lower VP and PP in the complement position, as in the representation adopted in (28). The issue concerning RM does not arise nor the one concerning the preservation of the hierarchy of arguments. See Larson (1988), and the representation adopted in 3 for unaccusatives. Nothing changes in the execution of the proposal to be discussed below with either assumption.
(30)  a Ha dato un libro a Maria Gianni
      has given a book to Maria Gianni
   b Ha messo il libro sul tavolo Maria
      has put the book on the table Maria

These sentences can be attributed the same status as the possible subject inversion clauses displaying the order VOS discussed in 1.4 above (cfr. (18)B,D, for which I did not adopt any diacritic, as I do here for the sake of simplicity). Given this similarity and the observation that the whole VP has to be considered “given” information in order for the sentences to attain the level of (marginal) acceptability, it seems natural to attribute to them the same analysis as the one attributed to VOS clauses. The sentences in (31) should then be analyzed as involving a topicalized “remnant” VP and a focalized subject in the specifier of the Focus projection. (30) sharply contrasts with (31), where complement reordering has taken place in combination with subject inversion (B&S, (24)b,d):

(31)  a *Ha dato a Maria un libro Gianni
      has given to Maria a book Gianni
   b *Ha messo sul tavolo il libro Maria
      has put on the table the book Maria

Why should there be such a sharp degradation? In order to answer this question, the appropriate analysis of the complement reordering phenomenon must be first spelled out.

As noted in B&S, complement reordering appears to be a further case of clause internal focalization. Consider the following question-answer pair, from B&S:

(32)  A Che cosa hai restituito a Maria?
       What have you given back to Maria?
   B Ho restituito a Maria le chiavi
       (I) have given back to Maria the keys
   B’ #Ho restituito le chiavi a Maria
       (I) have given back the keys to Maria

where B’ is pronounced with normal non-interrupted intonation (cfr. footnote 42). If an overt lexical subject is also present in the question, it shows up as a preverbal subject in the answer:

(33)  A Che cosa ha restituito a Maria Gianni?
       What has given back to Maria Gianni?
   B Gianni ha restituito a Maria le chiavi
       Gianni has given back to Maria the keys

40 The usual feeling of redundancy and slight unnaturalness is associated with (33)B, as in the case of (18)B, D. A more natural answer would not repeat the lexical PP, but would utilize a dative pronoun:

(i)  le ho restituito le chiavi
     (I) to-her+gave back the keys

The crucial observation here does not concern this relatively subtle fact, but the sharp contrast between (33)B vs (33)B’.

20
The direct object “le chiavi” constitutes the “new” information. Assume that it is then associated with the specifier of the Focus phrase in both (32)B and (33)B. I take the latter sentence containing a preverbal subject to be a clear indication that focalization is clause internal here. Recall that no special intonation is associated with these clauses. Suppose that sentences like (32)B and (33)B involve clause internal topicalization of the remnant VP overtly containing V and PP\(^{41}\); the direct object is focalized in the specifier of the Focus phrase, the preverbal subject is in the appropriate preverbal subject position.

Schematically, the derivation in (34) (disregarding details):\(^{42}\)

\[(34)\quad [\text{Gianni} \ldots \text{ha} \ldots [\text{TopicP} [k e \text{\textit{restituito}} e_j \text{a Maria}] [\text{FocusP} [k \text{le chiavi}] [\text{TopicP} [k \text{VP} e_k ]]]] \ldots ]
\]

\[
\text{Gianni} \ldots \text{has} \ldots \text{given back to Maria the keys}
\]

Consider now the possibility of a sentence like (35):

\[(35)\quad \text{C’è qualcosa che [restituito a Maria] Gianni ancora non ha: le chiavi}
\]

There is something that given back to Maria Gianni hasn’t yet: the keys

For reasons which do not concern us here, this kind of preposing discussed in Cinque (1990), requires presence of negation in the clause. A sentence like (35) can be analyzed as involving further movement of the clause internal topic to the clause external one, present in the periphery.\(^{43}\) Note that here the preverbal subject and the auxiliary remain in the same clause internal positions as in (34). The natural assumption is that the direct object too fills the same position as in (34), i.e. the clause internal focus position:

\[(36)\quad \ldots [k e \text{\textit{restituito}} e_j \text{a Maria}] \ldots [\text{Gianni} \ldots \text{ancora non ha} \ldots [\text{TopicP} [k e \ldots [\text{FocusP} [k \text{le chiavi}]
\]

\[
[\text{TopicP} [k \text{VP} e_k ]]]] \ldots ]
\]

\[
\ldots \text{given back to Maria} \ldots \text{Gianni} \ldots \text{hasn’t yet} \ldots \text{the keys}
\]

In conclusion, we can make the hypothesis that complement reordering is an instance of clause internal focalization of the object, combined with (usually clause internal) topicalization of the remnant VP.

---

\(^{41}\) The auxiliary should fill its regular position within the relevant inflectional head which normally hosts it. If checking of the past participle features needs to take place, we could assume that the relevant heads (Asp, at least) should immediately dominate the VP before the Topic - Focus phrases. Alternatively, movement to the checking head could start out from the Topic phrase, as already assumed for the direct object in VOS (cfr. footnotes 21, 31).

\(^{42}\) Note that an alternative answer to (33)A, could be:

(i) Gianni ha restituito le chiavi # a Maria

Gianni has given back the keys #to Maria

with a clear interruption between the direct object and the following PP. (The pause can be enriched with contrastive stress on the direct object, but contrast is not necessary here). (i) involves Topicalization/marginalization of the PP. More on that in Belletti (1999). Given the organization of the information structure of the clause, I assume the object to be in the specifier of the Focus phrase also in this case.

\(^{43}\) As in Rizzi’s articulated CP structure, the Topic phrase is found below the relative complementizer which is the highest C level.
containing V and PP. We are now ready to provide an interpretation of the reasons accounting for the sharply degraded status of the sentences in (31) involving complement reordering combined with subject inversion.

Intuitively, what rules out (31) should be the fact that both complement reordering and subject inversion are instances of clause internal focalization. If we admit, as in standard X’ theory, that only one specifier position is available for X’ projection, it follows that either the object or the subject can be focalized, but not both. This is the same line of explanation developed by B&S.\(^{44}\) Since we have assumed that Focus is a syntactic feature which licenses DPs, if multiple specifiers are admitted (Chomsky (1995, 1998)), the same effect is obtained under the natural assumption that the same syntactic feature (here Focus) cannot license more than one DP argument. Let us see how the computation works to rule out V PP O S. Indeed, in the system developed here this order is not derivable. It cannot be derived with (remnant) VP topicalization of V + PP, combined with movement into the specifier of the Focus phrase of both O and S since, as we just said, we assume that Focus can license at most one argument in its specifier(s). An alternative derivation would be one where O would move to the specifier of the Focus phrase and the subject would remain within the VP in its base position. But we already know that such derivation is not permitted.

An alternative order with respect to (31), where the subject would precede the direct object is also ruled out. As (37) shows, this order is equally impossible (B&S (24e)):

(37) *Ha dato a Maria Gianni un libro  
    has given to Maria Gianni a book

A sentence like (37) is not derivable. It does not seem to be possible to topicalize V + PP leaving O VP internal and moving S into the specifier of the Focus phrase, as the linear order would require. Such a topicalization would necessarily pick up O as well.\(^{45}\) Note that the linear order could be obtained if O is also topicalized into the lower Topic phrase surrounding the Focus phrase. In this case the object

\(^{44}\) More generally, every clause allows for just one constituent to be focalized (Calabrese (1992)). Thus, not only clause internal focalization can involve one constituent at most, but clause external focalization as well:

(i) *IL LIBRO; A MARIA, Gianni non ha ancora dato  
    THE BOOK, TO MARIA, Gianni hasn’t given yet

Interestingly, clause internal and clause external focalization cannot combine either:

(ii) *IL LIBRO, le darà Gianni  
    THE BOOK to-her+will give Gianni

where “Gianni” should be construed as new information focus and “il libro” as contrastive focus. This might suggest that at the interpretive level, clause internal and clause external focalization are indeed a unified phenomenon, despite the differences that they manifest in their distribution as well as their informational pragmatics. In the spirit of Chomsky’s (1977), one could suggest that, at LF, all instances of focalization are reduced to one single process. I will not attempt to provide a formalization of the this idea here. See Rizzi (1997) for relevant discussion.
acquires the status of a “marginalized” constituent in Antinucci & Cinque’s sense. This derivation correlates with an interruption right before the marginalized object and a downgrading intonation on it:

(38)   Ha dato a Maria Gianni # un libro⁴⁶
       Has given to Maria Gianni # a book

3. Remarks on “unaccusatives”.

The unaccusative/ergative hypothesis as formulated in the eighties assumes that verbs of this class do not have an external argument but all arguments are VP internal. The surface preverbal subject of unaccusatives is in fact a deep object, and, even more importantly, the postverbal subject of unaccusatives is in fact not only a deep but also a surface object. This is, we may say, the core of the hypothesis. Note, however, that once the assumption is made that all subjects, which can appear as preverbal subjects, originate VP internally, independently of the class to which the verb belongs, the natural question arises as to where the difference between unaccusatives on the one side and transitives and unergatives on the other should be located.

I would like to address the question by considering unaccusatives which also select a prepositional argument beside the direct one. Note, incidentally, that this is the most common situation.⁴⁷ If a VP internal structure like the one in (27) is assumed for transitive verbs which select both a direct and an indirect argument, it would appear that the most direct updating of the unaccusative hypothesis should hypothesize a structure along the lines of (39):

(39)   VP
       1

⁴⁵ O cannot independently move to its (Case) checking position since this position is higher than both the Topic phrase and the Focus phrase, by assumption.
⁴⁶ The peack of the intonation is on S, here. For a closer discussion of marginalization in this connection see Belletti (1999).
where no argument is associated with the non-thematic VP internal subject position. Adapting traditional accounts, I would assume that O needs licensing and that this can be done VP internally with unaccusatives (Belletti (1988)). Suppose that licensing is done through Case in the VP specifier filled by O in (40). Notice now that, once V moves outside the VP into some functional head, this immediately yields the linear order: V O PP. The structure being unaccusative, we know that O is in fact S, namely the argument which can also appear as a preverbal (agreeing) subject. In 1.3.2 we observed that V S PP structures are fairly acceptable with S licensed in the specifier of the clause internal Focus projection and PP licensed in situ, VP internally, for V unergative intransitive. We are now phrasing the unaccusative hypothesis in such a way that the same V S PP linear sequence is attributed a different syntactic representation with all arguments licensed VP internally in the described way. Can we detect different behaviors of the two kinds of postverbal subjects?

As has been frequently pointed out in the literature, V S PP is a perfectly acceptable order with unaccusatives when S is indefinite. Within the terms of the analysis sketched out above, we can claim that there is an indefinite requirement for VP internally licensed subjects. Sentences like (40) are usually considered the most natural occurrences of unaccusative structures:

(40) a E’ arrivato uno studente al giornale
    has arrived a student at the newspaper
 b E’ entrato un ladro dalla finestra
    has come in a thief from the window

---

47 Possibly, all unaccusatives do in fact select a prepositional argument, which can remain silent. See also the discussion in Moro (1997).
48 May be such a VP internal, as such inherent (partitive?) Case position, is systematically available for (certain ) indefinite objects. This updates Belletti’s (1988) analysis. According to Longobardi (1998), unmodified bare plural subjects in the existential interpretation are allowed to remain VP internal with both unaccusative and intransitive verbs. We could speculate that they should qualify for VP internal licensing through the VP internal Case, which severely limits the choice of possible DP’s.

As a general approach, I assume that verbal agreement is obtained through the relation with the associate expletive in the preverbal subject position. See footnote 18 in this connection.
In 1.3.2 we attributed to the sentences in (15) a, c, e, a slightly marginal status, indicated as (?). The proposed analysis, however, did not make one expect any marginality. Let us now comment on this. Suppose that the slight marginality of sentences like (15)a, c repeated here:

(15)   a(?) Ha telefonato Maria al giornale  
       has phoned Maria to the newspaper  
       c(?) Ha parlato uno studente col direttore  
       has spoken a student with the director

is due to the existence of a certain tendency whereby there is a preference in having the focussed constituent in the clause final position.\(^{49}\) We can make the hypothesis that the marginality of (15) is due to the fact that this tendency is not respected. Since the structure does not violate any deep constraint it is ruled in but acquires a marginality flavor. Note now that no marginality whatsoever is associated with the sentences in (41). The different analysis attributed to these sentences with a VP internal postverbal indefinite subject not involving focalization provides a natural interpretation for the contrast.

If the VP internal position for the unaccusative postverbal subject is reserved to indefinite noun phrases, a definite subject should fill a different position. Such position can be identified with the one filled by postverbal subjects of non-unaccusative verbs which we have identified with the specifier of the clause internal Focus phrase. If this assumption is correct, we expect that sentences containing a definite subject and an unaccusative verb should be attributed essentially the same level of marginality as the marginal sentences of (15). I think that this photographs the situation in a fairly accurate way:\(^{50}\)

(41)   a ?E’ arrivato lo studente al giornale  
       has arrived the student at the newspaper  
       b ?E’ entrato Mario dalla finestra  
       has come in Mario from the window

No marginality is detectable anymore if no prepositional complement follows the postverbal subject, as no violation of the tendency to locate the focussed constituent in the last position is produced:

(42)   a E’ arrivato lo studente  
       has arrived the student  
       b E’ entrato Mario  
       has come in Mario

\(^{49}\)Note that the last constituent is often also the most embedded one, hence the one receiving Nuclear stress. This makes it the most prominent one. There seems to be a tendency/preference to have matching between Focus and prominence. See in this connection Cinque (1993), and the line of research in Zubizarreta (1998).

\(^{50}\)These data illustrate the so called “Definitness Effect” (DE) which has often been reported to give rise to a relatively subtle and often difficult violation where different factors come into play related to the interpretation, the informational organization of the clause, the intonation. This is at the source of a complex gradation in the grammaticality judgements associated to the relevant sentences. Note that the marginality of (42) is a bit stronger than that of (15). This could be related to the fact that the first/unmarked location for the postverbal subject of unaccusatives is the VP internal one. Since this position is only compatible with indefinite subjects, this requires that sentences like (42) be reanalyzed as involving not a VP internal, but a VP external, focussed subject.
It is well known that *ne* cliticization gives a perfect output when it takes place from a postverbal unaccusative subject, but a marginal output when it takes place from an unergative one. (43) illustrates the contrast:

(43)  

a. (?) Ha telefonato uno studente al giornale  
      has phoned a student to the newspaper  

b. ??Ne ha telefonato uno al giornale  
      of-them+has telephoned one at the newspaper  

c. E’ arrivato uno studente al giornale  
      has arrived a student at the newspaper  

d. Ne è arrivato uno al giornale  
      of-them+has arrived one at the newspaper

Updating Belletti (1988), I interpret the contrast between (44)b and d as due to the fact that (*ne*) extraction is possible from the VP internal (subject) position but does not work equally well from the VP external Focus position.

The natural question to ask now is what is the status of clauses containing a reordering of the postverbal subject and the prepositional object of an unaccusative verb. We note first of all that such a reordering is possible:

(44)  

a. E’ arrivato al giornale uno studente  
      has arrived at the newspaper a student  

b. E’ entrato dalla finestra un ladro  
      has come in from the window a thief

These sentences can be attributed the same status as the double complement sentences involving reordering. The null assumption is that they are attributed the same analysis with a topicalized (remnant) VP and a focalized subject. Note that if this analysis is on the right track we expect *ne* cliticization to

---

51 Comparable to the status of the same cliticization process out of a direct object of a transitive verb (Burzio (1986), Belletti & Rizzi (1981)). At least for indefinite direct objects we can assume the same structural analysis as the one assumed for the postverbal subject of unaccusatives. See footnote 48.

52 It gives rise to a CED type effect (see the discussion in B&S). I assume that the specifier of the Focus phrase is an impossible extraction site since it is a derived not L-marked position. On the other hand, similarly to the preverbal subject position, it can be considered an A position (differently from the clause external Focus phrase). This is suggested both by the fact that DPs are licensed there according to the proposed analysis and by the empirical phenomenon of verbal agreement, which holds with a focalized inverted subject (through the relation with the associate expletive in the preverbal subject position; see footnotes 18, 48).

53 This is because we are systematically interpreting reordering as focalization in the specifier of the Focus phrase. This assumption excludes the possibility of leaving the indefinite subject in the VP internal position in this case.
have the same status in both cases. This status should be a marginal one, since we saw that extraction from a noun phrase in the specifier of the Focus phrase gives rise to marginality. This is indeed what we find. (45)a, b containing an unaccusative verb and (45)c containing a double complement verb are all rather marginal. Their status compares with that of (43)b:

(45)   
a ??Ne è arrivato al giornale uno
      of-them+has arrived at the newspaper one
b ??Ne è entrato dalla finestra uno
      of-them+has come in from the window one
c ??Ne ho dato a Gianni uno
      (I) of-them+have given to Gianni one
